Floorfoam

Floorfoam is a high performance acoustic insulation product designed specifically to cushion and reduce the flow of sound through floors in both existing and new buildings.

Made from extruded polyethylene (XPE), it is supplied in rolls that are easy to carry and install for the professional installer and skilled DIYer alike.

Below screed

Floorfoam is widely used as a resilient acoustic layer in screeded separating floors between apartments, floors of offices, floors of hotels, floors of schools/hospitals and for any other acoustic separation requirement in new and refurbished buildings.

Available in 5mm or 10mm (and coupled with Floorfoam Easy Edge Strip) this solution offers complete acoustic isolation for excellent airborne and impact sound reduction.

Laminate floor underlay

Floorfoam is the ideal solution for below laminate floors, it is light and very easy to lay. Compared to the cost of the wood floor the underlay is an inexpensive yet extremely important part of the total investment as the correct solution can enhance the quality of a wood and laminate floor.

Solutions in 2mm and 5mm are offered with enhanced acoustic and damp proofing properties available in the 5mm.
